

## Forklift Grapple

Forklift Grapple - Grapples work in conjunction with the crowning operation of the bucket cylinder situated on the excavator. They can mount directly onto the jib or whichever quick hitch that is in bucket position. Grapples are most often meant for the processing and handling of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has added support bridging. This particular manufactured design offers the grapple with maximum strength and support by stopping the body from breaking and rotating throughout its function.

All of the moving parts that encompass the grapple, together with the toes, are constructed of hardened steel. The rotating points have been specifically designed to be able to guarantee supreme closing force and holding ability. The person operating it has the capacity to deal with all sizes and varieties of materials using the jaws fitted at the end of the grapple with toes. This enables the jaws to close through one another in a finger configuration for utmost handling capacity.
